Logon Duration Optimization with ControlUp

Among the biggest challenges IT admins face is slow logons. A lengthy logon duration frustrates users, and often results in excess help desk calls, resulting in IT staff wasting precious resources to remediate the problems.
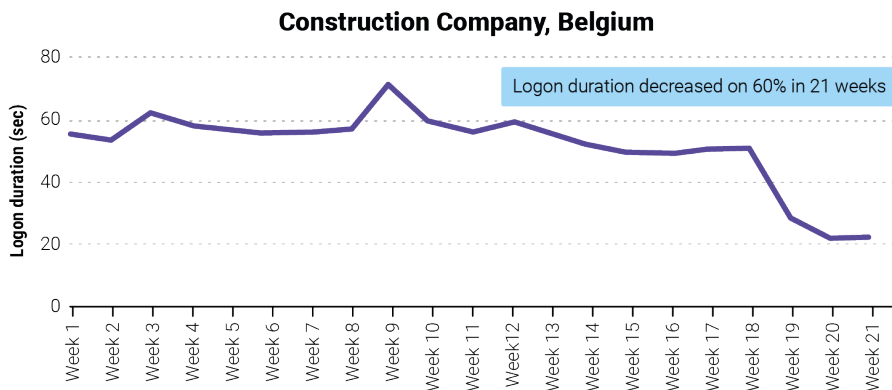

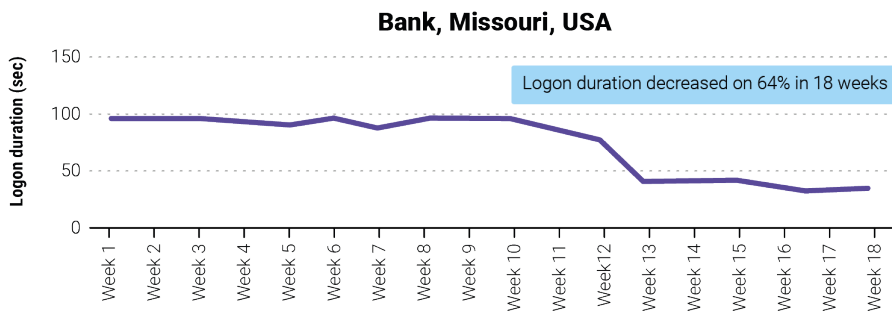

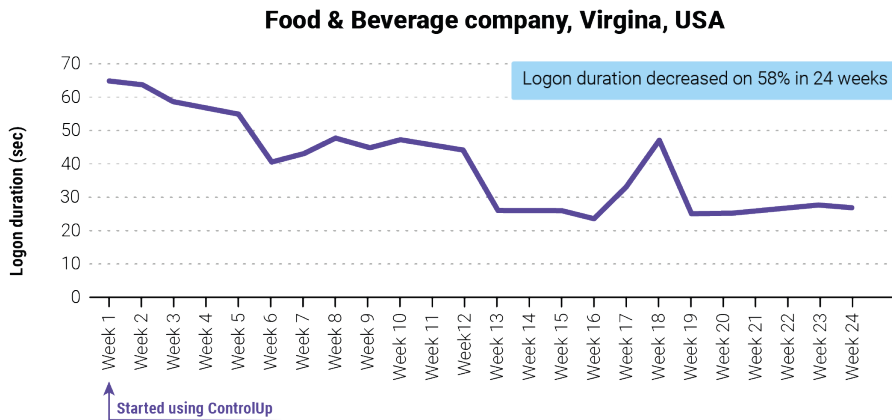

Now, more than ever, business continuity and delivering an exceptional user experience are vitally important. The world's workforce is now working from home, and system administrators are under pressure to deliver a seamless end-user experience, so their teams can stay productive.
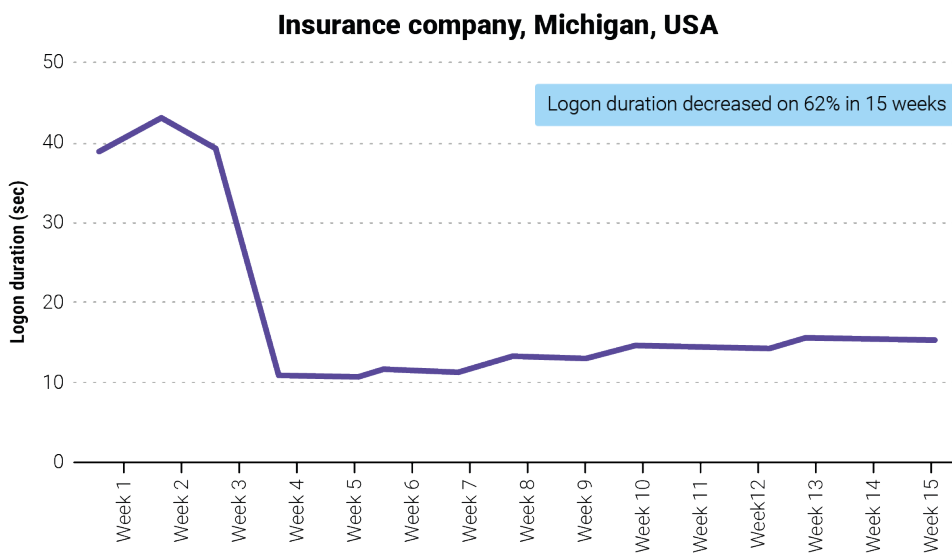

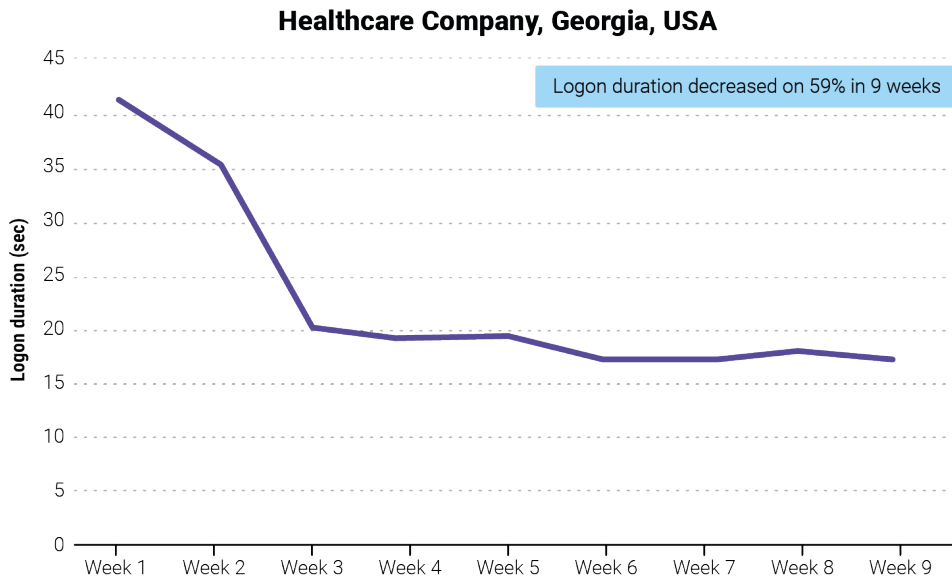

That's where ControlUp comes in. ControlUp maintains a library of hundreds of scripts to help system administrators automate fixes to persistent problems, including logon duration. The ControlUp "Analyze Logon Duration" script gives admins a clear window into information related to logon duration in their environments, so they can remediate problems quickly and get their end-users back to work fast.

66% of the companies using ControlUp improve their logon duration already in the first 2-24 weeks

✓ 53% of the companies improve their logon duration more than 10%
